GitLab is an incredibly powerful open source code collaboration platform, git repository manager, issue tracker and code reviewer. It integrates with issue trackers, continuous integration services and its Enterprise Edition has phenomenal LDAP and Active Directory support.

1. What can we do currently?

Right now you can connect a GitLab repository with a Taiga project and generate a one-way communication (from GitLab to Taiga) to:

- **Change the status of an epic, user story, issue, or task in Taiga with the commit message:** you may want to read more about this feature in the article ["Changing elements status via commit message"](#).
- **Attach commits in an epic, user story, issue, or task of Taiga with the commit message:** you may want to read more about this feature in the article ["Attach commits to elements via commit message"](#).
- **Create issues on Taiga when they are created on GitLab.**
- **Add comments to the connected issues on Taiga when they are created on GitLab.**

In Taiga an issue is connected with a GitLab issue if it was created by the GitLab integration. In the detail page of an issue on Taiga you can see a link under the subject to the original issue in GitLab.

2. And what can't we do?

- **Dual synchronization:** currently the integration functionality only allows receiving messages from GitLab. Taiga can't communicate with GitLab (the one-way communication is from GitLab to Taiga), so changes made in Taiga won't be reflected in GitLab.
- **Show commit links in Taiga issues:** If you name a story, task or issue in a commit message (by its reference number) a link to commit won't appear in Taiga.
- **Sync current GitLab issues and comment when the integration module in Taiga is enabled:** the integration only works with the future issues and comments added in GitLab.

Currently GitLab offers a limitation on its webhooks system that must be considered. It is not hardcore but it's good to know them to be aware of the limitation that exist.

- GitLab doesn't sign the messages so Taiga only can confirm the origin checking the IPs in the request.

WARNING

Integration will always take time so please be patient. If you need a specific integration and you feel ready to get a machete and get into the Taiga, please review our [API Docs](#) and our section in [Taiga](#) resources about ["How you can contribute?"](#). If you need help with a specific feature, you can always get in touch with our community through our [community space](#).

3. Configure the integration module in Taiga

1. Go to **Admin > Integrations > GitLab**
2. Fill **secret key** or use the auto generated one
3. Copy the **payload URL** input
4. Optionally you can define the valid emitter IPs or IP ranges to validate the origin of the requests

The screenshot shows the Taiga Admin interface. On the left is a sidebar with navigation links: Projects, The Princess Bride, Epics, Scrum, Kanban, Issues, Search, Wiki, Team, and Settings. The main content area is divided into two columns. The left column has a table with headers 'PROJECT' and 'WEBHOOKS'. Under 'PROJECT', there are links for ATTRIBUTES, MEMBERS, PERMISSIONS, INTEGRATIONS (highlighted in blue), and PLUGINS. Under 'WEBHOOKS', there are links for GITHUB, GITLAB (highlighted in blue), BITBUCKET, and GOGS. The right column is titled 'Gitlab' and contains configuration fields: 'Secret key' with a text input containing '7br5476fhg7b641b2a0857bcdce28d114', 'Payload URL' with a text input containing 'https://api.taiga.io/api/v1/gitlab-hook?project=50493&key=7br5476ft' and a copy icon, and 'Valid source IPs (separated by ,)' with a text input containing 'Gitlab requests are not signed so the best way of verifying the origin is by IP, if the field'. Below these fields is a green 'SAVE' button and a link: '? Do you need help? Check out our support page!'.

4. Configure Webhooks in your GitLab repository

Go to your repository

1. Click on **Webhooks**
2. On that screen set the url with the payload url of this screen.
3. Taiga currently listens for two different kind of events from GitLab:
 - a. Push events: changing element status via commit message
 - b. Comments: issue comments created in GitLab appear automatically in Taiga
 - c. Issues events: issues created in GitLab appear automatically in Taiga
4. Click on **"Add Webhook"**

Webhooks

Webhooks can be used for binding events when something is happening within the project.

URL

http://example.com/trigger-ci.json

Trigger

☒ **Push events**

This url will be triggered by a push to the repository

☐ **Tag push events**

This url will be triggered when a new tag is pushed to the repository

☐ **Comments**

This url will be triggered when someone adds a comment

☐ **Issues events**

This url will be triggered when an issue is created/updated/merged

☐ **Merge Request events**

This url will be triggered when a merge request is created/updated/merged

☐ **Build events**

This url will be triggered when the build status changes

SSL verification

☒ **Enable SSL verification**
